Complete Logic of the Administrator's Workflow

This document describes the full range of actions and processes an administrator can perform from the dashboard to manage the platform's offers, bookings, and users.

Phase 1: Managing Travel Products (The Catalog)

The administrator has full control over the trips offered on the site. Management is handled through several logical layers.

1. **Managing Tours (The Main Itineraries)**
    - **Creation:** The admin accesses a "Manage Tours" section. There, they can create a new "Tour" by providing basic information:
        - `Tour Name` (e.g., "South India's Coastal Beauty")
        - `Main Image` (URL for the Hero banner image)
        - `Detailed Itinerary` (a structured form to enter day-by-day details: Day 1 Title, Day 1 Description, etc.)
    - **Modification:** They can edit this basic information at any time.
    - **Activation/Deactivation:** A simple toggle switch allows making a tour visible or invisible on the public site.
2. **Managing Service Tiers (The Commercial Offers)**
    - **Action:** After creating a Tour, the admin clicks on "Manage Tiers" next to it.
    - **Creation:** They can add a service tier (e.g., "Super Prime") by filling out a detailed form:
        - `Tier Name` ("Super Prime Package")
        - `Base Price` (in INR)
        - `Hotel Type` ("Luxury 4-5 Star")
        - `Included Vehicle` (selected from a predefined list of vehicles)
        - `Inclusions Summary` (for display on the card, e.g., "Luxury Hotel, 1 Lunch")
    - **Modification/Deletion:** They can edit or delete a service tier at any time.
3. **Managing Add-Ons**
    - **Creation:** In a "Manage Add-Ons" section, the admin creates a library of reusable options:
        - `Option Name` ("Candlelight Dinner")
        - `Price` (in INR)
        - `Description`
    - **Association:** On a Tour's management page, they can associate the relevant "Add-Ons" with that trip.
4. **Managing Vehicles**
    - **Creation:** In a "Manage Vehicles" section, the admin defines the list of available vehicles for bookings.
        - `Vehicle Name` ("7 Seater SUV")
        - `Capacity` (number of passengers)
        - `Price per Day` (in INR)

Phase 2: Managing the Booking Lifecycle (The Core Business)

The dashboard is the central hub for tracking each prospect, from the initial inquiry to finalization.

1. **Receiving a New Inquiry (`Inquiry Pending`)**
    - **Notification:** The dashboard displays a visible alert for each new inquiry.
    - **Action:** The admin clicks on the inquiry to see all its details:
        - Complete customer information (name, verified email, phone).
        - The chosen Tour and Service Tier.
        - The travel date and number of people.
        - The list of requested additional vehicles and options.
        - The **estimated** quote calculated by the system.
2. **Validating and Sending the Quote (`Quote Sent`)**
    - **Key Action:** This is the manual validation step. The admin checks the availability of hotels and vehicles for the requested dates.
    - **Tool:** They have a form where they can:
        - Confirm the estimated price.
        - **Adjust the final price** if necessary (e.g., due to seasonality or a special request).
    - **Final Action:** They click **"Finalize & Send Quote"**.
    - **Effect:** The booking status changes to `Quote Sent`, the final price is locked in, and the quote email is automatically sent to the customer.
3. **Tracking Payments (`Payment Confirmed`)**
    - **Notification:** When a customer pays, the booking status in the dashboard automatically changes to **"PAID"** (via the payment gateway's webhook).
    - **View:** Paid bookings are clearly identified (e.g., in green). The admin can view the transaction details.
4. **Managing Cancellations (`Cancelled`)**
    - **Notification:** If a customer cancels (before or after payment), the booking appears as "Cancelled" in the dashboard.
    - **Action (if a refund is required):** The booking is marked as "Refund Pending". The dashboard provides a tool for the admin to initiate the refund via the Stripe API and/or manually mark the refund as "Completed".
5. **Finalizing the Trip (`Trip Completed`)**
    - **Action:** After the trip has ended, the admin marks the booking as "Completed".
    - **Effect:** The system automatically sends an email to the customer inviting them to leave a review.

Phase 3: User and Security Management

1. **Managing Customer Reviews**
    - **Moderation:** A "Manage Reviews" section allows the admin to see all reviews submitted by customers. They can choose to approve them (to appear on the site) or hide them.
2. **Managing Password Reset Requests**
    - **Notification:** A "Password Resets" section displays pending requests.
    - **Action:** The admin sees the email of the user who made the request. They can verify if it's a known customer.
    - **Validation:** They click an **"Approve"** button.

    - **Effect:** The system sends the secure reset email to the user. This is the "backdoor" that you control.
3. **Managing Administrators**
    - **Promotion:** Creating a new administrator is done via the secure method we defined: creating a normal account, then promoting it manually via `psql`. The dashboard can display the list of users and their roles, but changing the role is intentionally kept as a technical operation for security reasons.

NB: If anything to modify or to add, please let me know!
