Complete Logic of the Booking Journey for "Ebenezer Tours"

This document is our reference guide. It details every step, every business rule, and every interaction between the user, the frontend, and the backend.

Phase 1: User Account Creation and Verification

Objective: To ensure that every user is unique, authentic, and has accepted the terms and conditions.

1. **Registration (Register)**
    - **User Action:** Clicks on "Register" and fills out the form (Name, Email, Password).
    - **System Action (Backend):**
        - Creates a user in the `Utilisateurs` table.
        - Assigns the status `is_verified = false`.
        - Generates a unique `verification_token`.
        - Sends a verification email to the provided address.
    - **User View:** Message "Registration successful! Please check your email to verify your account."
2. **Email Verification**
    - **User Action:** Clicks on the link in the email.
    - **System Action (Backend):**
        - Verifies the validity of the `verification_token`.
        - Updates the user: `is_verified = true` and deletes the token.
    - **User View:** Message "Account verified! You can now log in."
3. **Login**
    - **User Action:** Logs in with their email and password.
    - **System Action (Backend):**
        - Checks that the email exists and the password is correct.
        - **Verifies that `is_verified` is `true`.**
    - **User View:**
        - If successful: is logged in and redirected.
        - If not verified: message "Login failed. Please verify your email address first."

Phase 2: The Detailed Booking Process

Objective: To offer a personalized, flexible, and transparent booking experience.

1. **Discovery and Selection**
    - **User Action:** Navigates the site (which will offer multiple tours in the future), chooses a tour (e.g., "Coastal Beauty Tour"), and lands on that tour's detail page.
    - **User View:** The detail page presents the 3 service tiers for that specific tour ("Super Prime", "Prime", "Mini Prime"). The user clicks "View Details & Book" on their preferred tier.
2. **Trip Configuration (Booking Page)**
    - **User Action:** Is redirected to the smart booking form.

- **User View:**
  - **Currency:** They can choose their currency (INR, USD, EUR). All prices update accordingly.
  - **Basic Info:** They enter the travel date (the calendar blocks dates within the next 5 days) and the number of people.
  - **Vehicles:** The system displays the included vehicle. If the number of people exceeds the capacity, a sub-form appears to add extra vehicles. This process repeats until the capacity is sufficient.
  - **Options:** They check the "add-ons" they want.
  - **Quote:** A summary of the total price updates in real-time.
- **User Action:** Accepts the "Terms & Conditions" and clicks "Submit Inquiry".

3. **Submission and Validation**
   - **System Action (Frontend):** Sends all the information (selections, currency, etc.) to the backend.
   - **System Action (Backend):**
     - **Security:** Recalculates the total price based on the rates stored in the database to prevent any manipulation.
     - Converts the final price into the currency chosen by the client.
     - Creates a new entry in the `Bookings` table with the status `Inquiry Pending` and all detailed information.
     - Sends confirmation emails to the user and the administrator.
   - **User View:** Confirmation page "Inquiry received! We will send you a final quote shortly."

Phase 3: The Booking Lifecycle (After the Inquiry)

Objective: To provide clear tracking and notifications at every key stage.

1. **Status `Inquiry Pending`**
   - **Admin View:** Sees the new inquiry in their dashboard. This is where they **track and validate the tour**.
   - **User View ("My Bookings"):** Sees their inquiry with the status "Awaiting review by our team (response in under 30 min)".
2. **Status `Quote Sent`**
   - **Admin Action:** Checks availability, confirms the price, and clicks "Send Quote".
   - **System Action:** The status changes to `Quote Sent`. An expiration date of **48 hours** is recorded.
   - **User View:** The status changes to "Quote received, awaiting payment (valid for 48h)". A "Pay Now" button appears. A "Cancel Inquiry" button is also available.
3. **Status `Payment Confirmed`**
   - **User Action:** Pays via the payment gateway.
   - **System Action:** The status changes to `Payment Confirmed`. The exact payment time (`payment_timestamp`) is recorded.
   - **User View:** The status changes to "Booking Confirmed!". A "Cancel Booking" button appears. It is only clickable if **less than 24 hours have passed since the `payment_timestamp`**.
4. **Status `Cancelled`**
   - **Before payment:** The user can cancel without any charge.

    - **After payment:** The user can cancel and get a refund **only within 24 hours of payment**. After this period, cancellation is no longer possible through the interface.
5. **Status** `Trip Completed`
    - **Admin Action:** Manually marks the trip as completed.
    - **System Action:** Can send an email to the user inviting them to leave a review.

Phase 4: Account Recovery (The "Backdoor")

- **User Action:** Clicks on "Forgot Password" and enters their email.
- **System Action:** Creates a reset request with the status "pending".
- **Admin Action:** Sees the request in their dashboard and clicks "Approve".
- **System Action:** Sends an email to the user with a secure, single-use reset link.
- **User Action:** Clicks the link and sets a new password.

This logic is our master plan. It is complete, secure, and covers all the requirements you have formulated.
